

# Internet topology dynamics in ten minutes

Sergey Kirgizov under the supervision of Clémence Magnien

Complex Networks  $\subset$  LIP6  $\subset$  (UPMC  $\times$  CNRS)

4 March 2014

# Outline

- ① What do we observe?
- ② Why it is so important?
- ③ How do we study our observations?

What do we observe?

# Internet IP-level topology

**Nodes:** IP addresses

**Links:** connections between hosts

# Internet IP-level topology

**Nodes:** IP addresses

**Links:** connections between hosts

# Ego-centered views

(shortest) paths between **monitor** and **destinations**

# Ego-centered views

a measurement by tracetree

# Ego-centered views

another measurement by tracetree  
**load-balancing**

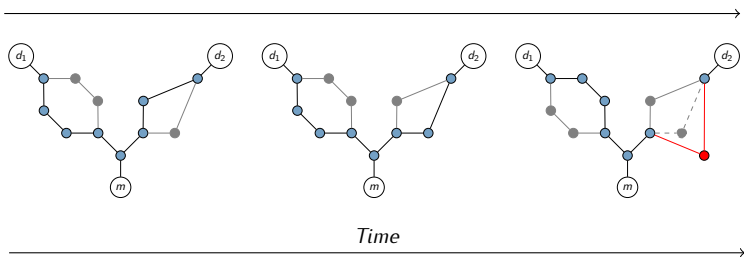

# Ego-centered views

yet another measurement by tracetree  
**evolution of routes**

# Ego-centered view dynamics

Fast periodic measurements  $\implies$  study of the dynamics

Why we should study this?

# Some possible applications

- Develop a good model of the network
- Security (unstable routes means more spyware?)
- Robustness of the network and protocols
- Event detection
- Web caching
- *etc*

Can we *see* the dynamics?

# Evolution of symmetric difference between measurements (one destination)

Measurement is a set of IP-links

$m_1$  : first measurement

$m_i$  :  $i$ -th measurement

$$d(m_1, m_i) = |\overline{m_1 \cap m_i}|$$

# Evolution of symmetric difference between measurements (one destination)

Measurement is a set of IP-links

$m_1$  : first measurement

$m_i$  :  $i$ -th measurement

$$d(m_1, m_i) = |\overline{m_1 \cap m_i}|$$

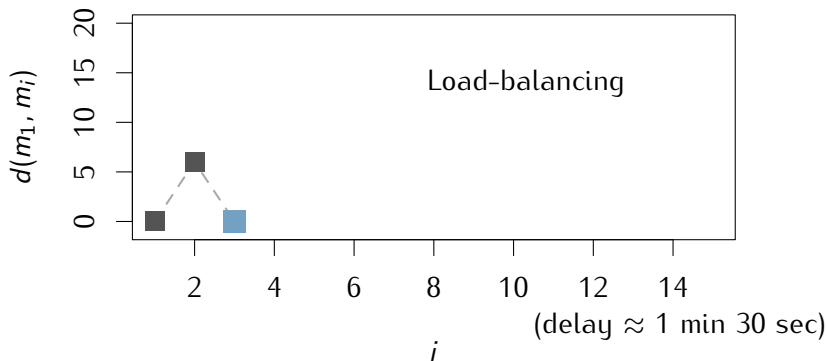

# Evolution of symmetric difference between measurements (one destination)

Measurement is a set of IP-links

$m_1$  : first measurement

$m_i$  :  $i$ -th measurement

$$d(m_1, m_i) = |\overline{m_1 \cap m_i}|$$

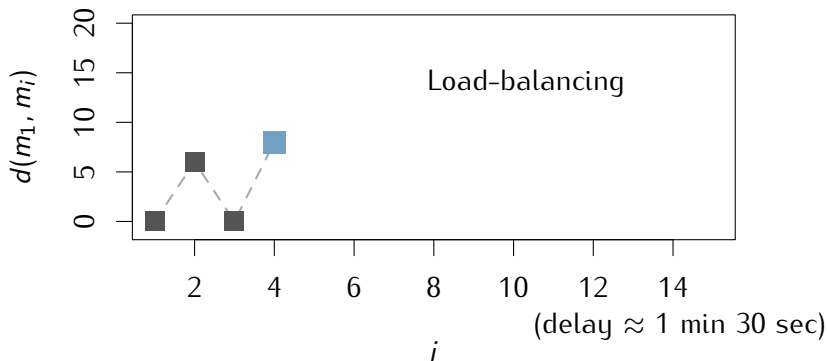

# Evolution of symmetric difference between measurements (one destination)

Measurement is a set of IP-links

$m_1$  : first measurement

$m_i$  :  $i$ -th measurement

$$d(m_1, m_i) = |\overline{m_1 \cap m_i}|$$

# Evolution of symmetric difference between measurements (one destination)

Measurement is a set of IP-links

$m_1$  : first measurement

$m_i$  :  $i$ -th measurement

$$d(m_1, m_i) = |\overline{m_1 \cap m_i}|$$

# Evolution of symmetric difference between measurements (one destination)

Measurement is a set of IP-links

# Overview of problems and methods

## Methods:

- Real-world measurements
- Simulated measurements using random graphs
- Theoretical study of dynamic random graphs
- Stochastic process estimation from partial observations
